Player Origin Snaps Report

Jump-To

- Leaguewide Pages
- Team Pages
- Methodology

Introduction

This is a report about what type of NFL player gets the most snaps. There are only three types of players on an NFL roster:

1. Homegrown Picks
2. Drafted Elsewhere
3. Undrafted

Special cases exist but ultimately every player is 1, 2, or 3. It can be shown when homegrown picks get more snaps there are better team outcomes: higher winning percentage, more playoff success, and longer head coach tenures. Conversely, teams that play more undrafted players have less success. And snaps to players drafted elsewhere appear to have almost no relationship to team success.

Correlation is not always causation. But the idea that more snaps to more Homegrown Picks is a good thing should be self-evident. When we consider its implications we can see it really does affect (and reflect) everything. And here we measure it.

Leaguewide Season-to-Date Player Origin Snap Percentages

Table shows season-to-date snap percentages for each player origin. For definition and methodology of percentages of snaps jump here. Table is ranked by homegrown picks. It can be shown this type of player has the most effect on team outcomes. We will see this on the scatters page as the season develops.

Homegrown Pick Rank	Team	Homegrown Pick	Elsewhere Pick	Undrafted
1	Ravens	72.9	17.2	9.9
2	Chiefs	70.8	20.1	9.1
3	Packers	69.5	18.6	11.9
4	Buccaneers	67.7	21.1	11.1
5	Eagles	65.8	25.3	8.9
6	Bengals	62.0	29.8	8.3
7	Bills	61.4	24.3	14.3
8	Colts	59.8	22.4	17.8
9	Chargers	58.0	30.1	11.9
10	Seahawks	56.8	21.2	22.0
11	Cardinals	54.3	33.2	12.6
11	Jaguars	54.3	27.0	18.6
13	49ers	54.2	28.7	17.2
14	Lions	54.0	26.9	19.1
15	Saints	53.0	28.8	18.2

Percentage of Snaps Methodology

Percentages of snaps used throughout report. “Snaps” is semi vague. The more precise term would be “opportunities.” We can’t simply take the total game snaps from the stat sheet because there are 11 slots per snap. We have to either 1) multiply the total snaps by slots or 2) compute total snaps as the sum of all snaps taken by all players. For simplicity we just use “snaps.” And so for player origin i in $\{\text{Homegrown Picks}, \text{Elsewhere Picks}, \text{Undrafted}\}$ and some game k:

$$\text{Percentage of Snaps Player Origin}_{i,k} = \frac{\sum_{j=1}^{n} \text{Snaps Player Origin}_{i,j}}{\text{Total Snaps}}$$

Where Total Snaps is either total game snaps times 11 or the sum of all individual snaps and $\sum_{i=1}^{3} \text{Percentage of Snaps Player Origin}_i = 1$. And then we can roll this up to any multi-game dimension (team-to-date, season-to-date, etc.) with weighted average $P_{i,d}$ across some dimesion d as:

$$P_{i,d} = \sum_{k=1}^{n} P_{i,k} \cdot w_k$$

Where $P_{i,k}$ is $\text{Percentage of Snaps Player Origin}_i$ for some game k and w_k is Total Snaps_k divided by $\sum_{d=1}^{n} \text{Total Snaps}_d$.
